`	Urgent	Not Urgent
Important	● Read location from location.txt ● Calculate coordinates and fetch tomorrow's forecast ● Check minimum temperature against threshold ● Check for rain ● Write to forecast.txt	● Desktop notification instead of outputting to file. ● Use an api to get the current estimated location based off of public ip. ● Threshold for cold/not cold for jacket updates dynamically instead of fixed.
Not Important	● Cron for scheduling ● Requests library for api calls and parsing json. ● Datetime to parse string into date.	● Phone notification ● Clothing advice based on LLM analysis of temperatures. ● Graphical interface
